UCR Time Series Classification Archive

Please reference as:

Dau, Hoang Anh, Eamonn Keogh, Kaveh Kamgar, Chin-Chia Michael Yeh, Yan Zhu, Shaghayegh Gharghabi, Chotirat Ann Ratanamahatana, Yanping Chen, Bing Hu, Nurjahan Begum, Anthony Bagnall, Abdullah Mueen and Gustavo Batista (2018). “The UCR Time Series Classification Archive.” https://www.cs.ucr.edu/~eamonn/time_series_data_2018/

Welcome!

Dear Colleague,

If you are reading this, you are interested in using the UCR Time Series Classification Archive. This archive is a *superset* of, and completely replaces [8]. The current version, thereafter referred to as Fall 2018 expansion, will eventually replace Summer 2015 release [9]. The archive originally was born out of our frustration with papers reporting error rates on a single dataset, and claiming (or implicitly suggesting) that the results would generalize [6]. However, while we think the availability of previous versions of the UCR Archive has mitigated this problem to a great extent, it may have opened up other problems.

- 1) Several researchers have published papers on showing “*we win some, we lose some*” on the UCR Archive. However, there are many trivial ways to get “*win some, lose some*” type results on these datasets (For example, just smoothing the data, or generalizing from 1-NN to k -NN etc.). Using the archive can therefore *apparently* add credence to poor ideas (very sophisticated tests are required to show *small* but *true* improvement effects [3][7]). In addition Gustavo Batista has pointed out that “*win some, lose some*” is worthless unless you know *in advance* which ones you will win on! [4]. Dau et al. discuss this in great detail [10].
- 2) It could be argued that the goal of researchers should be to solve real world problems, and that improving accuracy on the UCR Archive is at best a poor proxy for such real world problems. Bing Hu has written a beautiful explanation as to why this is the case [2].

In spite of the above, the community generally finds the archive to be a very useful tool, and to date, more than 1,200 people have downloaded the UCR archive, and it has been referenced several hundred times.

We are therefore delighted to share this resource with you. We encourage you to read the paper accompanies this new archive expansion [10]. The password you need to unlock the data download is available in this document, *read on* to find it.

Best of luck with your research.

Eamonn, Anh and the Team

Data Format

Each of the datasets comes in two parts, a TRAIN partition and a TEST partition.

For example, for the **Fungi** dataset we have two files, `Fungi_TEST.txt` and `Fungi_TRAIN.txt`

The two files will be in the same format, but are generally of different sizes.

The files are in the standard ASCII format that can be read directly by most tools/languages.

For example, to read the data of **Fungi** dataset into MATLAB, we can type...

```
>> TRAIN = load('Fungi_TRAIN.txt');  
>> TEST = load('Fungi_TEST.txt');
```

...at the command line.

There is one time series exemplar per row. The first value in the row is the class label (an integer between 1 and the number of classes). The rest of the row are the data sample values. The order of time series exemplar carry no special meaning, and is in most cases random. A small number of datasets have class label starting from 0 or -1 by legacy.

Sanity Check

In order to make sure that you understand the data format, you should run this simple piece of code to test *SyntheticControl* dataset (you can cut and paste it, it is standard MATLAB).

Note that this is slow “teaching” code. To consider all the datasets in the archive, you will probably want to do something more sophisticated (indexing, lower bounding etc).

Nevertheless, we highly recommend you start here.

```
function UCR_time_series_test %%%%%%%% (C) Eamonn Keogh %%%%%%
TRAIN = load('SyntheticControl_TRAIN.txt'); % Only these two lines need to be changed to test a different dataset. %
TEST = load('SyntheticControl_TEST.txt' ); % Only these two lines need to be changed to test a different dataset. %
%%%%%%%
TRAIN_class_labels = TRAIN(:,1); % Pull out the class labels.
TRAIN(:,1) = []; % Remove class labels from training set.
TEST_class_labels = TEST(:,1); % Pull out the class labels.
TEST(:,1) = []; % Remove class labels from testing set.
correct = 0; % Initialize the number we got correct
for i = 1 : length(TEST_class_labels) % Loop over every instance in the test set
    classify_this_object = TEST(i,:);
    this_objects_actual_class = TEST_class_labels(i);
    predicted_class = Classification_Algorithm(TRAIN,TRAIN_class_labels, classify_this_object);
    if predicted_class == this_objects_actual_class
        correct = correct + 1;
    end;
    disp(['int2str(i), ' out of ', int2str(length(TEST_class_labels)), ' done']) % Report progress
end;
%%%%%% Create Report %%%%%%
disp(['The dataset you tested has ', int2str(length(unique(TRAIN_class_labels))), ' classes'])
disp(['The training set is of size ', int2str(size(TRAIN,1)), ', and the test set is of size ', int2str(size(TEST,1)), '.'])
disp(['The time series are of length ', int2str(size(TRAIN,2))])
disp(['The error rate was ', num2str((length(TEST_class_labels)-correct)/length(TEST_class_labels))])
%%%%%% End Report %%%%%%
%%%%%%%
% Here is a sample classification algorithm, it is the simple (yet very competitive) one-nearest
% neighbor using the Euclidean distance.
% If you are advocating a new distance measure you just need to change the line marked "Euclidean distance"
%%%%%%
function predicted_class = Classification_Algorithm(TRAIN,TRAIN_class_labels,unknown_object)
best_so_far = inf;
for i = 1 : length(TRAIN_class_labels)
    compare_to_this_object = TRAIN(i,:);
    distance = sqrt(sum((compare_to_this_object - unknown_object).^2)); % Euclidean distance
    if distance < best_so_far
        predicted_class = TRAIN_class_labels(i);
        best_so_far = distance;
    end
end;
```

```
>> UCR_time_series_test
1 out of 300 done
2 out of 300 done
...
299 out of 300 done
300 out of 300 done
The dataset you tested has 6 classes
The training set is of size 300, and the test set is of size 300.
The time series are of length 60
The error rate was 0.12
```

In this package we have produced a spreadsheet that gives basic information about the datasets (number of classes, size of train/test splits, length of time series etc)

In addition, we have computed the error rates for:

- Euclidean distance
- DTW, unconstrained
- DTW, after learning the best constraint in from the train set*
- Default rate (that is, *the most probable class*). To be consistent, we display default error rate, which is $(1 - \text{default_rate})$.

*Note that our simple method for learning the constraint is not necessarily the best (as explained in the next slide).

You can download the entire spreadsheet displayed below in [CSV](#) format or [Excel](#) format.

Worked Example

We can use the Archive to answer the following question. *Is DTW better than Euclidean distance for all/most/some/any problems?*

As explained in [4], if DTW is only better on *some* datasets, this is not very useful unless we know ahead of time that it will be better. To test this we can build a Texas Sharpshooter plot (see [4] for details).

In brief, after computing the baseline (here, the Euclidean distance) we then compute the **expected improvement** we would get using DTW (at this stage, learning any parameters and settings), then compute **the actual improvement** obtained (using these now hardcoded parameters and settings).

When we create the Texas Sharpshooter plot , each dataset fall into one of four possibilities.

In our worked example, we will try to optimize the performance of DTW, *looking only at the training data* and predict its improvement (which could be negative), in a very simple way.

Expected Improvement: We will search over different warping window constraints, from 0% to 100%, in 1% increments, looking for the warping window size that gives the highest 1-NN training accuracy (if there are ties, we choose the smaller warping window size).

Actual Improvement: Using the warping window size we learned in the last phase, we test the holdout test data on the training set with 1-NN.

Note that there are better ways to do this (learn with increments smaller than 1%, use k -NN instead of 1-NN, do cross validation within the test set etc). However, as the next slides show, the results are pretty unambiguous even for this simple effort.

Texas Sharpshooter Plot [4]

The results are strongly supportive of the claim “DTW better than Euclidean distance for most problems”

We sometimes had difficulty in predicting *when* DTW would be better/worse, but many of the training sets are tiny, making such tests very difficult.

For example, **8** is *BeetleFy*, with just 20 train and 20 test instances. Here we expected to do a little better, but we did a little worse.

In contrast, for **66** (*LargeKitchenAppliances*) we had 375 train and 375 test instances, and were able to more accurately predict a large improvement.

(after plotting in MATLAB, the code is in Appendix A, you can zoom in to avoid the visual clutter seen to the right).

Suggested Best Practices/Hints

1. If you modify the data in anyway (add noise, add warping etc), please give the modified data back to the archive before you submit your paper (we will host it, and that way a diligent reviewer can test your claims while the paper is under review).
2. Where possible, we strongly advocate testing and publishing results **on all datasets** (to avoid cherry-picking), unless of course you are making an explicit claim for only a certain type of data (i.e. classifying **short** time series). In the event you don't have space in your paper, we suggest you create an extended tech report online and point to it. Please see [4] (esp. Fig 14) for some ideas on how to visualize the accuracy results on so many datasets.
3. If you have additional datasets, we ask that you donate them to the archive in our simple format.
4. When you write your paper, please make *reproducibility* your goal. In particular, explicitly state all parameters. A good guiding principle is to ask yourself Could a smart grad student get the exact same results as claimed in this paper with a days effort?. If the answer is no, we believe that something is wrong. Help the imaginary grad student by rewriting your paper.
5. Where possible, make your code available (as we have done), it will makes the reviewers task easier.
6. If you are advocating a new distance/similarity measure, we strongly recommend you test and report the 1-NN accuracy (as we have done). Note that this does **not** preclude the addition of other tests (we strongly encourage additional test), however the 1-NN test has the advantage of having no parameters and allowing comparisons between methods.
7. Note that for 85 datasets of Summer 2015 release, the data are z-normalized by legacy. Paper [7] explains why this is very important. For 43 datasets of Fall 2018 expansion (this release), data are kept as is unless they were already z-normalized by donating source.

Appendix A: Sharpshooter Plots

Here is the code we used to produce the Sharpshooter plots.

```
function [] = plot_texas_sharpshooter()
% Compute a Texas Sharpshooter plot of DTW over Euclidean Distance. See
% Batista, Wang and Keogh (2011) A Complexity-Invariant Distance Measure
% for Time Series. SDM 2011
% % Last updated April 2019 by Hoang Anh Dau

% For example, if we want to construct the figure for comparison between
% Euclidean distance (ED) and Dynamic Time Warping distance (DTW), we
% compute the following statistics:
%
% expected_accuracy_gain = DTW_train_accuracy / ED_train_accuracy
% actual_accuracy_gain = DTW_test_accuracy / ED_test_accuracy

% By definition, the train accuracy of DTW is always greater than the train
% accuracy of ED, which makes expected accuracy gain meaningless in this
% context. Therefore, we only use ED test accuracy, considering it as the
% 'baseline'.

% In the result spreadsheet texas_plot_2018.csv:
% row 1 is header
% column 1 is dataset name
% column 2 is ED train error rate
% column 3 is ED test error rate
% column 4 is DTW train error rate
% column 5 is DTW test error rate

% read in result spreadsheet
result_file = 'texas_plot_2018.csv';
result = importdata(result_file, ',', 1);
error_rates = result.data;

% convert error to accuracy, by subtracting from 1
texas_values = 1 - error_rates;

expected_accuracy_gain = texas_values(:,3)./texas_values(:,2);
actual_accuracy_gain = texas_values(:,4)./texas_values(:,2);

% produce plot just so we can get Xlim and Ylim
figure;
scatter(expected_accuracy_gain,actual_accuracy_gain, 20, 'r', 'filled');

Xaxis = get(gca,'XLim');
Yaxis = get(gca,'YLim');

hold on; axis square;

% bottom left quadrant
patch([Xaxis(1) 1 1 Xaxis(1)], [Yaxis(1) Yaxis(1) 1 1], [0.9843 0.8471 0.5765]);
% top right quadrant
patch([1 Xaxis(2) Xaxis(2) 1], [1 1 Yaxis(2) Yaxis(2)], [0.9843 0.8471 0.5765]);

scatter(expected_accuracy_gain,actual_accuracy_gain, 20, 'r', 'filled');

xlabel('Expected Accuracy Gain');
ylabel('Actual Accuracy Gain');

% plot with symbol as number
for i = 1: length(texas_values(:,1))
    text(expected_accuracy_gain(i),actual_accuracy_gain(i),int2str(i))
end

% % plot with symbol as dataset name
% % note that the order of texas_names and texas_values must be the same.
% texas_names = result.textdata(2:end, 1);
% for i = 1: length(texas_values(:,1))
%     text(expected_accuracy_gain(i),actual_accuracy_gain(i),texas_names(i,:),'rotation',+30)
% end

end
```

Here the result summary file for making the Texas Sharpshooter plot.

texas_plot_2018.csv

- row 1 is header
- column 1 is dataset name
- column 2 is ED train error rate
- column 3 is ED test error rate

The Password

- As noted above. My one regret about creating the UCR Archive is that some researchers see improving accuracy on it as *sufficient* task to warrant a publication. I am not convinced that this should be the case (unless the improvements are very significant, or the technique is so novel/interesting it might be of independent interest).
- However, the archive is in a very contrived format. In many cases, taking a real world dataset, and putting it into this format, is a *much* harder problem than classification itself!
- Bing Hu explains this nicely in the introduction to her paper [2], I think it should be required reading for anyone working in this area.
- The password is the missing words from this sentence “*Why would ***** use the archive and not acknowledge it?*”
- The sentence is on the second page of [10]. The paper is available for download on the UCR Archive webpage or at <https://arxiv.org/abs/1810.07758>

Personal note from Eamonn

I am somewhat bemused by the hundreds of papers that use the UCR Archive, but do not acknowledge or thank the archivists.

Many such papers thank funding agencies, people that donated CPU time, friends that gave feedback etc. But many of these papers could not have been written without access to dozens of labeled time series datasets.

These dozens of labeled datasets were provided, completely for free! And these datasets represent (now) at least a thousand hours of work by my students and collaborators, to create or collect, to clean and annotate, to compute benchmarks etc.

It does seem like an acknowledgment would be classy ;-)

Acknowledgments

The authors would like to thank Prof. Eamonn Keogh and all the people who have contributed to the UCR time series classification archive for their selfless work. We also thank the anonymous reviewers for their valuable advice.

This work has been supported by Major Project of High Resolution Earth Observation System of China (Grant No.03-Y20A04-9001-15/16), the CNES TOSCA-VEGIDAR Program, and CAS-CNRS Joint Doctoral Promotion Program.

About the baseline results reported – Before you ask

- Did you z-normalize the data before passing to the algorithm?
- There can be different implementations of DTW. Some implementations divide the distance by the warping path length; some use a different step patterns etc. We use MATLAB implementation of DTW [r1].

```
dist = dtw(time_series_1, time_series_2, window_size, 'squared');
```

- We use MATLAB implementation of k -NN [r2]

```
mdl = fitcknn(train_data, train_label, 'Standardize', 0, 'NSMethod', 'exhaustive');
```

- We use leave-one-out cross-validation to learn the warping constraint

```
cross_validation = crossval(mdl, 'LeaveOut', 'on');
```

- For constrained warping, if the percentage of time series length results in a real number, you can round up or round down. We round up.
- We round the error rate to four decimal places. For a more comprehensive result comparison and other resources, we recommend the UEA & UCR Time Series Classification Repository [r3].

About the baseline results reported – How we handle special cases

- For time series of different lengths:
 - In storing data: We pad NaN (to the end) to the length of the longest time series. This makes it convenient when loading data into MATLAB.
 - In computing baselines: We add low amplitude random numbers (to the end) to the length of the longest time series to make all time series of equal length.

```
% pad_len is the length of the padding
time_series = [time_series, rand(1, pad_len)/1000];
```
- For time series with missing values
 - In storing data: Missing values are represented with NaN (if NaN is at the end of the time series, it is not real missing values).
 - In computing baselines: We use linear interpolation.

```
time_series = fillmissing(time_series, 'linear', 2, 'EndValues', 'nearest');
```
- There are 14 datasets fall into these special cases. In the interest of reproducible research, we also provide the processed version (equal length, no missing values) of data that we used to produce the baseline results.

43 datasets added in Summer 2018

The figures follow are intended to offer a quick inspection of the data. For readability, depending on the scenario, the data may be normalized or may be not, the number of exemplars per class may be one, three or many.

ACSF1

One exemplar per class,
with z-normalization

AllGestureWiimoteX

Three exemplars per class,
without z-normalization

AllGestureWiimoteY

Three exemplars per class,
without z-normalization

AllGestureWiimoteZ

Three exemplars per class,
without z-normalization

BME

Three exemplars per class,
with z-normalization

Chinatown

Three exemplars per class,
with z-normalization

Crop

Three exemplars per class, with z-normalization

DodgerLoopDay

One exemplar per class,
with z-normalization

DodgerLoopGame

One exemplar per class,
without z-normalization

DodgerLoopWeekend

One exemplar per class,
without z-normalization

EOGHorizontalSignal

Three exemplars per class,
with z-normalization

EOGVerticalSignal

Three exemplars per class,
with z-normalization

EthanolLevel

Three exemplars per class,
with z-normalization

FreezerRegularTrain

Three exemplars per class,
with z-normalization

FreezerSmallTrain

One exemplar per class,
with z-normalization

Fungi

One exemplar
per class, with
z-normalization

GestureMidAirD1

Three exemplars per class,
without z-normalization

GestureMidAirD2

Three exemplars per class,
without z-normalization

GestureMidAirD3

Three exemplars per class,
without z-normalization

GesturePebbleZ1

Three exemplars per class,
without z-normalization

GesturePebbleZ2

Three exemplars per class,
without z-normalization

GunPointAgeSpan

Three exemplars per class,
with z-normalization

Left) GunPoint recording of 2003, *right)* GunPoint recording of 2018.
Top) Ann Ratanamahatana, *bottom)* Eamonn Keogh.
The female and male actors are the same individuals recorded fifteen years apart.

GunPointMaleVersusFemale

Three exemplars per class,
with z-normalization

GunPointOldVersusYoung

Three exemplars per class,
with z-normalization

HouseTwenty

One exemplars per class,
with z-normalization

InsectEPGRegularTrain

Three exemplars per class,
with z-normalization

InsectEPGSmallTrain

One exemplars per class,
with z-normalization

MelbournePedestrian

Three exemplars per class,
with z-normalization

MixedShapesRegularTrain

Three exemplars per class,
with z-normalization

MixedShapesSmallTrain

One exemplar per class,
with z-normalization

PickupGestureWiimoteZ

Three exemplars per class,
without z-normalization

PigAirwayPressure

One exemplar per class,
with z-normalization

PigArtPressure

One exemplar per class,
with z-normalization

PigCVP

One exemplar per class,
with z-normalization

PLAID

One exemplar per class,
without z-normalization

PowerCons

One exemplar per class,
with z-normalization

Rock

Three exemplars per class,
with z-normalization

SemgHandGenderCh2

One exemplar per class,
with z-normalization

SemgHandMovementCh2

One exemplar per class,
with z-normalization

SemgHandSubjectCh2

One exemplar per class,
with z-normalization

ShakeGestureWiimoteZ

Three exemplars per class,
without z-normalization

SmoothSubspace

Thirty exemplars per class,
with z-normalization

UMD

Three exemplars per class,
with z-normalization

85 datasets from Fall 2015 release

The figures follow are intended to offer a quick inspection of the data. For readability, depending on the scenario, the data may be normalized or may be not, the number of exemplars per class may be one, three or many.

Adiac

Three exemplars per class,
with z-normalization

ArrowHead

Three exemplars per class,
with z-normalization

Beef

Three exemplars per class,
with z-normalization

BeetleFly

Three exemplars per class,
with z-normalization

BirdChicken

Three exemplars per class,
with z-normalization

Car

Three exemplars per class,
with z-normalization

CBF

Three exemplars per class,
with z-normalization

ChlorineConcentration

Three exemplars per class,
with z-normalization

CinCECGTorso

Three exemplars per class,
with z-normalization

Coffee

Three exemplars per class,
with z-normalization

Computers

One exemplar per class,
with z-normalization

CricketX

One exemplar per class,
with z-normalization

CricketY

One exemplar per class,
with z-normalization

CricketZ

One exemplar per class,
with z-normalization

DiatomSizeReduction

One exemplar per class,
with z-normalization

DistalPhalanxOutlineAgeGroup

Three exemplars per class,
with z-normalization

DistalPhalanxOutlineCorrect

Three exemplars per class,
with z-normalization

DistalPhalanxTW

Three exemplars per class,
with z-normalization

Earthquakes

One exemplar per class,
with z-normalization

ECG200

Three exemplars per class,
with z-normalization

ECG5000

One exemplar per class,
with z-normalization

ECGFiveDays

Three exemplars per class,
with z-normalization

ElectricDevices

One exemplar per class,
with z-normalization

FaceAll

One exemplar per class,
with z-normalization

FaceFour

Three exemplars per class,
with z-normalization

FacesUCR

One exemplar per class,
with z-normalization

FiftyWords

One exemplar per class,
with z-normalization

Fish

Three exemplars per class,
with z-normalization

FordA

One exemplar per class,
with z-normalization

FordB

One exemplar per class,
with z-normalization

GunPoint

Three exemplars per class,
with z-normalization

Ham

Three exemplars per class,
with z-normalization

HandOutlines

Three exemplars per class,
with z-normalization

Haptics

Three exemplars per class,
with z-normalization

Herring

Three exemplars per class,
with z-normalization

InlineSkate

Three exemplars per class,
with z-normalization

InsectWingbeatSound

One exemplar per class,
with z-normalization

ItalyPowerDemand

Three exemplars per class,
with z-normalization

LargeKitchenAppliances

One exemplar per class,
with z-normalization

Lightning2

One exemplar per class,
with z-normalization

Lightning7

One exemplar per class,
with z-normalization

Mallat

One exemplar per class,
with z-normalization

Meat

Twenty exemplars per class, with z-normalization

MedicallImages

One exemplar per class,
with z-normalization

MiddlePhalanxOutlineAgeGroup

Three exemplars per class,
with z-normalization

MiddlePhalanxOutlineCorrect

Three exemplars per class,
with z-normalization

MiddlePhalanxTW

Three exemplars per class,
with z-normalization

MoteStrain

One exemplar per class,
with z-normalization

NonInvasiveFetalECGThorax1

One exemplar per class,
with z-normalization

NonInvasiveFetalECGThorax2

One exemplar per class,
with z-normalization

OliveOil

Three exemplars per class,
with z-normalization

OSULeaf

One exemplar per class,
with z-normalization

PhalangesOutlinesCorrect

Three exemplars per class,
with z-normalization

Phoneme

One exemplar per class,
with z-normalization

Plane

Three exemplars per class,
with z-normalization

ProximalPhalanxOutlineAgeGroup

Three exemplars per class,
with z-normalization

ProximalPhalanxOutlineCorrect

Three exemplars per class,
with z-normalization

ProximalPhalanxTW

Three exemplars per class,
with z-normalization

RefrigerationsDevices

One exemplar per class,
with z-normalization

ScreenType

One exemplar per class,
with z-normalization

ShapeletSim

One exemplar per class,
with z-normalization

ShapesAll

One exemplar per class,
with z-normalization

SmallKitchenAppliances

One exemplar per class,
with z-normalization

SonyAIBORobotSurface1

Three exemplars per class,
with z-normalization

SonyAIBORobotSurface2

Three exemplars per class,
with z-normalization

StarLightCurves

Three exemplars per class,
with z-normalization

Strawberry

Three exemplars per class,
with z-normalization

SwedishLeaf

One exemplar per class,
with z-normalization

Symbols

Three exemplars per class,
with z-normalization

SyntheticControl

One exemplar per class,
with z-normalization

ToeSegmentation1

One exemplar per class,
with z-normalization

ToeSegmentation2

One exemplar per class,
with z-normalization

Trace

Three exemplars per class,
with z-normalization

TwoLeadECG

Three exemplars per class,
with z-normalization

TwoPatterns

One exemplar per class,
with z-normalization

UWaveGestureLibraryAll

One exemplar per class,
with z-normalization

UWaveGestureLibraryX

One exemplar per class,
with z-normalization

UWaveGestureLibraryY

One exemplar per class,
with z-normalization

UWaveGestureLibraryZ

One exemplar per class,
with z-normalization

Wafer

One exemplar per class,
with z-normalization

Wine

Twenty exemplars per class, with z-normalization

WordSynonyms

One exemplar per class,
with z-normalization

Worms

One exemplar per class,
with z-normalization

WormsTwoClass

One exemplar per class,
with z-normalization

Yoga

One exemplar per class,
with z-normalization
